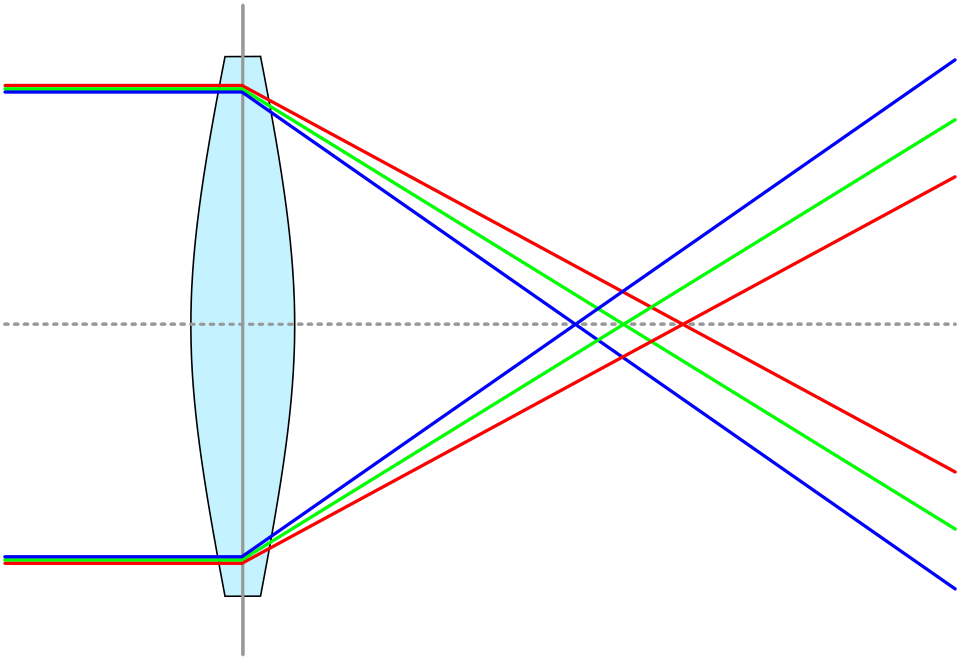
ABERRATION

Trumpet and Live Electronics



Taylor Brook

2018

about *Aberration*

Aberration is dedicated to Andy Kozar, written in the Summer and Fall of 2018.

This piece features the simple trajectory of a plain sine tone becoming more and more complex and distorted. This is realized with both the live trumpet and the electronic processing: the soft muted trumpet tone becomes the rough beating of singing and playing together. An accompanimental sine tone in the electronics becomes delay lines, harmonic exciters, clip distortion, and ever-thickening harmonies.

Technical Rider

General Guidelines:

Aberration is a piece for solo trumpet in C with electronics. The electronics consist of a microphone for the trumpet running though an audio interface into a computer running a Max/MSP patch out to a guitar amplifier. If a guitar amplifier is not available then the sound could come through concert speakers, either a mono speaker placed near the performer or a stereo pair. In a larger hall, I would suggest using guitar amplifier and then micing that amp to a stereo or mono cluster of speakers. The Max/MSP patch requires a trigger for cues, which can be realized either by a technician at the computer or via the performer using a MIDI or USB pedal. Further details are included in the MAX/MSP patch.

Equipment List (guitar amplifier option):

- Computer with max/msp (windows 10 or Mac, i7 7700 CPU or faster)
- Microphone for Trumpet (DPA clip-on, SM58, AEA N22 or similar)
- Mixer
- Audio Interface
- Direct Box (if needed for amplifier)
- Guitar Amplifier (Vox V212C 50-watt or similar)
- Appropriate cabling
- MIDI or USB pedal (if triggered by performer)

Equipment List (mono concert speaker option):

- Computer with max/msp (windows 10 or Mac, i7 7700 CPU or faster)
- Microphone for Trumpet (DPA clip-on, SM58, AEA N22 or similar)
- Mixer
- Audio Interface
- Concert Speaker
- Appropriate cabling
- MIDI or USB pedal (if triggered by performer)

Equipment List (stereo concert speakers option):

- Computer with max/msp (windows 10 or Mac, i7 7700 CPU or faster)
- Microphone for Trumpet (DPA clip-on, SM58, AEA N22 or similar)
- Mixer
- Audio Interface
- 2 Concert Speakers
- Appropriate cabling
- MIDI or USB pedal (if triggered by performer)

Performance Techniques

flz.: fluttertongue

norm.: normale, with a normal tone or technique

half-valve: press the valves part of the way down so that you may bend the pitch freely with an unfocused tone.

m.vib.: molto vibrato

s.vib.: senza vibrato

sing encircled notehead: vocalise through the trumpet on the pitch notated as a normal notehead with a circle around it while playing the unaltered noteheads in a normal fashion.

beating: produce a beating sound by playing and singing a unison (or octave) and then bending the sung note while holding the played note steady at pitch. As the bend begins to move away from a unison the beating will be slow and as the bending note moves farther from the unison the beating will become faster.

Microtones

The following acccidental nomenclature is used:

 approximately 1/4 tone flat or sharp (50 cents)

 approximately 1/6 tone flat or sharp (33 cents)

 approximately 1/12 tone flat or sharp (17 cents)

This piece relies heavily upon this just intonation scale:
