Axon

duo for contrabass and flute

Taylor Brook

2017

about *Axon*

Axon was written for Marilène Provencher-Leduc (flute) and Gaspard Daigle (contrabass), commissioned by the Ensemble Contemporain de Montréal and Jeunesse Musicales in connection with the juried award from the ECM+ Generations tour 2016. This score was written during the Spring and Summer of 2017.

The title of *Axon* refers to the long, thread-like part of a nerve cell that transmits pulses of electricity as communication throughout the human body. This music considers harmonic relationships as a metaphor for neural connection and individual pitches as neural nodes, which together create a network of relationships that are explored in musical terms.

Contemporaneously to writing this piece, the idea of neural networks and deep learning being used to write music is in rapid development, with the first few companies advertising computer-generated commercial music solutions. This is a promising area of research, where algorithmic composition based on a model could iterate infinite variations in a similar style. In the case of this piece of music, the idea of a neural network is more of a metaphor and a strict algorithmic approach is not followed. Instead, I concieved of certain aspects of the pitch as a neural network, and considered the axon, the fragile strands connecting the nodes. The fragility became an important image for the piece, how tenuous the connections in the brain can be.

microtonal notation

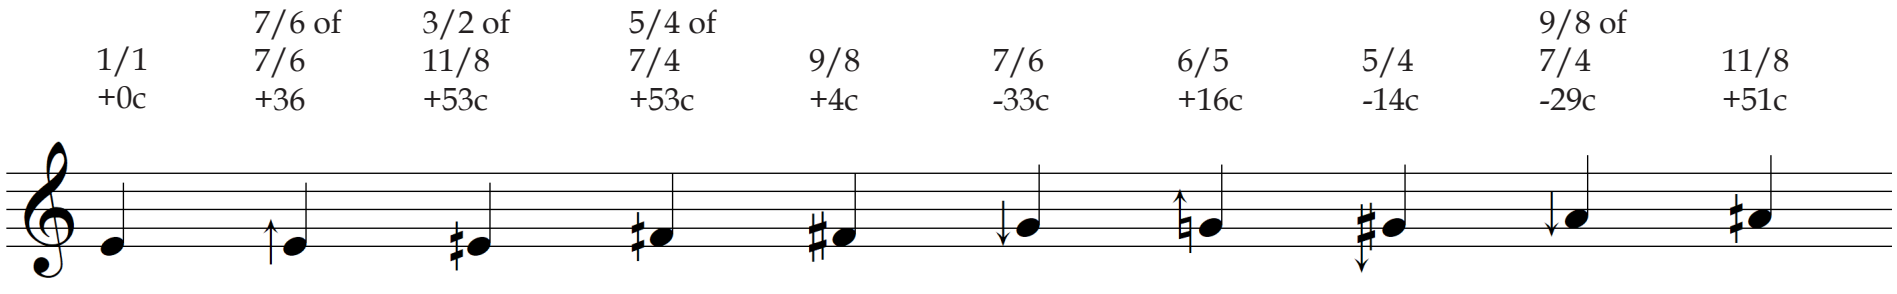
The following acccidental nomenclature is used:

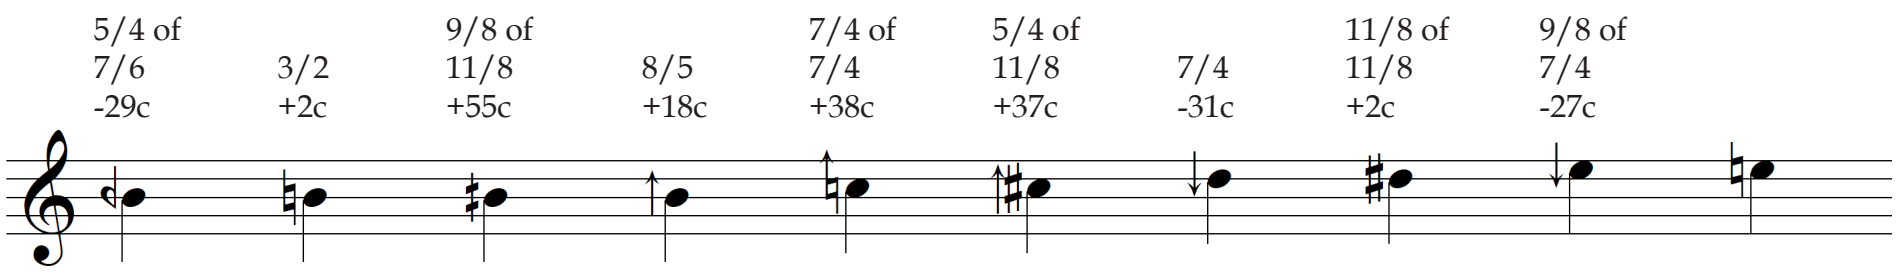
approximately 1/4 tone flat or sharp (50 cents)

approximately 1/6 tone flat or sharp (33 cents)

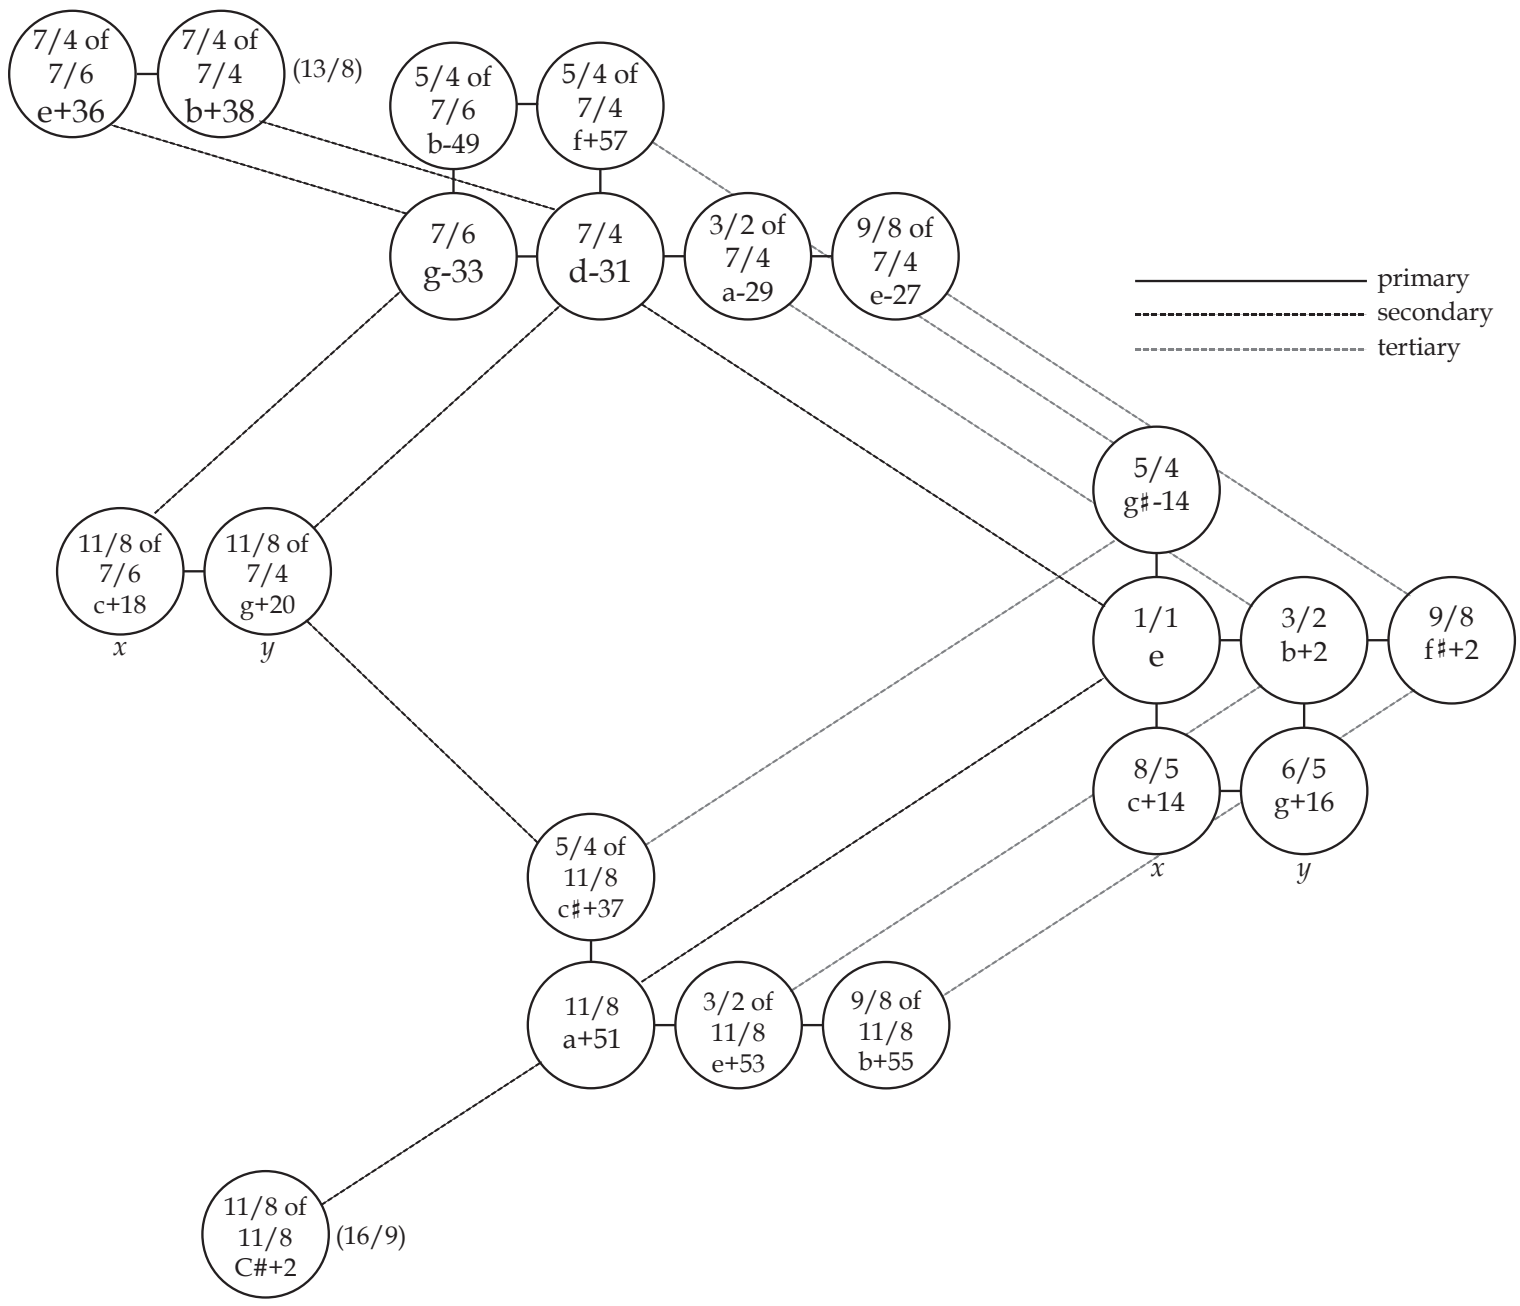
approximately 1/12 tone flat or sharp (17 cents)

The microtones in this piece of music are used to approximate the notes of the following scale, which is a collection of just intervals derived from the open strings of the retuned contrabass. The interval ratio in the key of E as well as the deviation in cents from equal temperament pitches is provided above each scale degree:



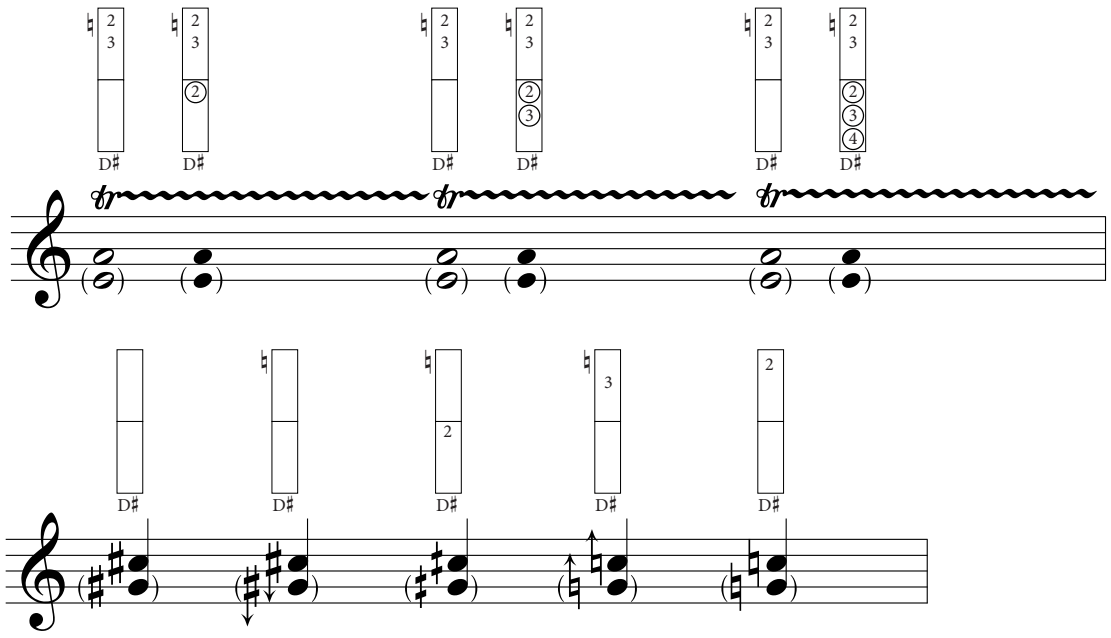


The harmonic relationships of the scale degrees can be understood using the chart below, which contains five dimensions: just major thirds (5/4) vertical, perfect fifths (3/2 horizontal), just sevenths (7/4) diagonal-left upwards, and just tritone (11/8) diagonal-left downwards. These relationships were represent clearly audible relationships between the pitches and was used extensively during the composition of the score.

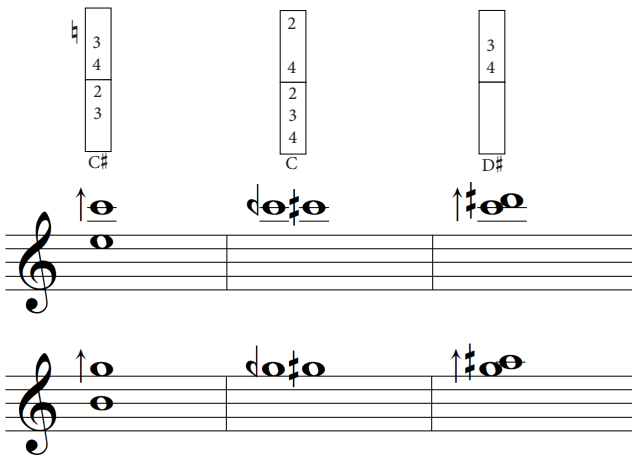


Alto Flute

Alto flute fingerings:
The combinations of fingering shown below should be possible on all alto flutes with or without a B extension. These fingerings were derived from *Techniques of Flute* by Carine Levine. If any of these fingerings are not possible on your flute, try to fing replacements that are as agile.



Alto flute multiphonics:
The following three multiphonics are used in the piece:



Bass

scordatura:
The strings of the bass are retuned. The low E string maintains the normal tuning, while the three other strings are returned to microtonal pitches with a close harmonic relationship to the low E. I would suggest obtaining a tuner that is able to tune to cents to check the tuning. More importantly, the strings chould be checked by ear between one another using the natural harmonics. A chart of the fundamental and first 12 overtones is provided below. The scale on the previous page was derived from these pitches. While the precise pitch of these overtones in a real world setting will not be absolutely precise, this is an understood reality and part of the compositional idea.

The score is written as sounding pitch – because the music is relatively slow and emphasizes pitch relationships, this should be a simpler solution than using a tablature staff.

multiphonics:
The following multiphonics are used in the score. This technique involves the performer touching the node on the string as indicated, like playing a harmonic, but with a specific bow placement and pressure that brings out the multiphonic chord. These multiphonics may seem unreliable at first, but with some practice they should become comfortable to play.

The same three multiphonics are used on each string:
